Microsoft Access

- Relational Database program

Use to track

- Customers
- Assets
- Orders
- etc.

1) Create tables
2) Order entry form
3) Write a query extracting insights from data
4) Create a report

Consists of columns, which store data fields, and rows which store database records

Tables: Store the data in the database & foundation of the database

Can be used to perform basic calculations

Queries: Enable you to extract data from your database & allows you to answer questions we have about our data.

Based on data tables & queries

Forms: Can be used to create a menu system. Useful for entering new data into a table / navigating through table records.

Generated from queries & tables

Reports: Allow you to organize & present data in a meaningful way to aid managerial decision-making

What you can create in Access

* Avoid using spaces in fieldnames
* Create meaningful descriptive names for fields/tables
* ones use letters numbers

Microsoft Access Process to Automate the process

Data Types

1) Short Text:
Data type is used to store most data that won't be treated like a number
- Text, • telephone #'s, • Zipcodes
- 255 characters (any combination of letters, numbers, and symbols

2) Long Text data types:
Data type used to store larger amounts of text.
- Any combination of letters, numbers, and symbols
- 65,536 characters.

3) The Number data Type:
Data type is used to store positive and negative numbers
The numbers contain decimal points

4) Data/Time data type
Used to store date or time information

5) Currency data type: Places ($) in front of the #
6) AutoNumber: Randomly assigned

7) Yes/No data type: Used to store data that has only two possible values (yes or no) True/False (on/off)

8) OLE Object: Used to store files created in other programs Word, Excel, Pic files, Sound files. Generally better to store as a attachment file

Hyperlink Data: Used to store links/websites or other folders or files on your computer.

Attachment: Store files for a database record. (ex: any type of file such as pics, docs, sounds, vids)

Calculated data type: is used to create a field that is generated by ~~another field~~ a formula.

Lookup Wizard: Simplify data entry
lookup field will give the user a list of items to choose from when entering another record.
Can come from another database table in the
