6/27/2025

How to use this to generate fin stmts

Macros

View > Right-click > Customize the ribbon

Use the record Macro in Developer tab

↳ This was able to automate the P&L even though there were some calculations that were off.
(R&S needs to check the macros)

The calculations were put in 3 steps
→ Each recording, Mr. Banza did the calcul.
O We just need to fix the calculations to automate the macros.

O I need to do more research about Co-pilot & how I can use it to facilitate the calculations + Explain it to Mr. Banza.

For me to do

# Recording Macros

6/30/2025

**Macros**: How to access personal workbook

- After I close the excel sheets, the personal workbook is hidden. Here is the following steps

To ensure a recorded macro is saved, you must save the excel sheet as an macro-enabled worksheet w/ the .xlsm extension if you want to use the macro again.

When you open the excel sheet next time

- View < Unhide (There should be the personal workbook.xlsm)
- Visual Basic Macro
- File < Options < Add-ins < manage < Disabled items < Go (It will not show the xlsm)

## Macros:

### Why use macros?

- To automate repetitive tasks
- Outsource the computer to do the task for you
  → File < Options < Customize ribbon < Developer < OK

### Macros tab: All shown in here

① **Record Macro:**
- Can be used to format & calculations
- Name it using no spaces / add _.

② **Use Relative Reference:**
- Use the starting point as the position & start running the macro in a different location on the sheet.

③ **Insert tab**
- Button
  - Insert a button press on it & it'll automate the macro.

### Visual Basic Code
- Code for macro & can be modified

# How to save it

## macros

The issue that I had, I did not save the Personal.XLSTART Excel file.

→ I found the location

* This PC > OS (C:) > Users > Myrka > App Roaming > Microsoft > Excel > Data XLSTART *

So in order to save Personal.XLSTART for the macros, you alt + F11 > Go to File > Save Personal

Afterwards whatever you did for the macro: you save the workbook in Microsoft VBA & Excel.
Excel sheet should be saved as a macro-enabled excel sheet

I saved it as Personal_BackUp

Macro System

What I need for the Dynamic

1.) Recognizes where key rows and columns are dynamically

2.) Applies calculations only when and where needed

3.) Adds/removes columns cleanly w/o shifting formatting

4.) Never touches merged cells or formulas unless told to

5.) Works regardless of whether client is big or small.

How to save Personal.XLSB into the G-Drive.
432 Riverhill Loop → Saved in another Personal.XLSB
→ Same thing for the invoicing macros

Example Invoicing Presentation

1) We are on Step 7 & 8 now

2) Go over the steps for Step 7 & 8

3) Go over the steps and what I want them to understand

4) Address the concerns
→ Already went over Step 2
→ Need to do Step 3 because of mapping.

Macros: How can we use it?

Ex: 432RLLC CIP YTD calculations

- When I used the macros, it calculated it incorrectly.
- I am wondering for the calculations, how many macros will be needed?
- The macros are created near of the end result

Mr. Garza wanted me to select M column where the square footage was @.

Steps I took to get there

1.) Ctrl + Shift + ↓ (Press on it until reached last)

2.) Press F2 (Depending on what keyboard you have Fn + F2

input formula = For me ($19/$M$4)

3.) in M7 (or selected cell) Press Ctrl + Enter

4.) The values for Saft are done

I am doing the invoicing & it is working

→ Steps 1-6 is done

→ One more step needs to be done

→ Possibly I cannot automate categorizing items in the e-column / I might not be able to do a macro that deletes the first part.

→ It does the calculations / Linking etc.

→ Next step is to try it on invoices that already are done.

→ Next step is to figure out the sharing to everyone then work on Riverhill loop.
