Limitations w/ VBA

- VBA is basically programming in C++ according to reddit.

→ Some observations I made

- Macros limitations lies in being able to make it dynamic. (working w/ big and small worksheets)
- VBA macros do not handle merged cells very well. (There are always formatting issues
- I am being very specific w/ ChatGPT, but the code it gives me sometimes doesn't work.
- Complex formatting like from Quickbooks easily break
- Hard to debug
- Slower w/ large data sets.
- Learning curve
- Runs when the Personal.XLSB is open.
- Hard to share in the office

Pros of VBA

- Built into Excel
- Custom Automation
- Highly Customizable
- Interacts w/ Excel interface
- Powerful w/ practice
- Can integrate w/ Microsoft Suite

When you might "outgrow" VBA

Explore other tools to supplement macros

1.) Power Query (relatively new)
2.) Power Automate
3.) Python programming language

When:

- You constantly fight merged cells, hidden rows, or messy Quickbooks formats.
- Your macros break often due to changing row/column sizes.
- You want automation that runs ~~[illegible]~~ w/ one click on fresh exports (w/o edit the code)
- You want to work w/ larger datasets efficiently
- You want better error-handling and debugging.
- You need to collaborate on the automation
